

# WHY I INVESTED

We have always observed strong results from Zahn Dental's Zirlux FC2 zirconia, so we were excited to switch recently to the new Zirlux 16+ pre-shaded discs. In trials, we observed time savings and an improved workflow. In a competitive market, anything we can do to standardize our process is important.

## CONSISTENCY AND SUPER TRANSLUCENCY

Daxton Grubb, Owner of R-Dent Dental Laboratory, on Zahn Dental's Zirlux 16+ zirconia

Available in both white and pre-shaded discs to produce all 16 VITA® classical shades and three bleach shades.

44% translucency at 1-mm thickness delivers super translucent esthetics.

**How does it help standardize processes?** The pre-shaded discs eliminate the need for green state coloring, which removes a variable and leads to more consistent outcomes.

**How would you describe the esthetics?** The added translucency is evident and results in restorations that more closely match that of natural teeth. In addition, the shades are right on.

**What feedback have you received?** My technicians instantly noticed the improved translucency and esthetics. We are producing consistent and esthetic zirconia restorations.
